

# **Enhanced State Estimation by Advanced Substation Monitoring**

## **Substation State Estimation (SSE) Software**

**Professor Mladen Kezunovic**

**Student Sasa Jakovljevic**

PSerc Project Review Meeting  
Texas A&M University

March 22<sup>nd</sup>, 2002  
College Station, TX

# Previous work has produced

- **Review of accuracy classes for measurement devices**
- **Classification of approaches to topology error detection**
- **Analysis of the substation model implementation**
- **Definition of measurement & consistency check algorithms**
- **Implementation of Three-phase simulation model (Substation SE Model)**
- **Specification of the interface between the system-wide SE the substation SE**

# Progress since the last review meeting and future work

- **Progress**

- Single-phase SIMULINK for Substation model is developed
- MATLAB program is rewritten to support parallel simulation & processing
- Two parts of the Substation State Estimation Software (SSES) were merged into one simulation/processing unit
- Appropriate Graphical User Interface (GUI) was built
- Substation control and bad data analysis modes are implemented
- Communication with two stage State Estimation program was accomplished through the table exchange files

- **Future work**

- Analyzing switching sequences & substation restoration
- Developing substation state transition algorithms & incorporation into the SSE Software as a new mode of operation

# Substation State Estimation Software (SSES)

- **Features**

- **Control over the simulation execution and performance**
- **Selection of Control or Bad Data mode**
- **Selection of initial Bus-split or Line-outage scenario**
- **Interactive status change of the switching element during simulation**
- **Displaying the processed measurement quantities as values next to the corresponding instrument**
- **Reporting the outcome of algorithm checks both as logical symbols and textual icons**
- **Providing the history of snapshot reports during the simulation execution**
- **Compact data output on the Graphical User Interface (GUI)**
- **Generation of snapshot table communication files**

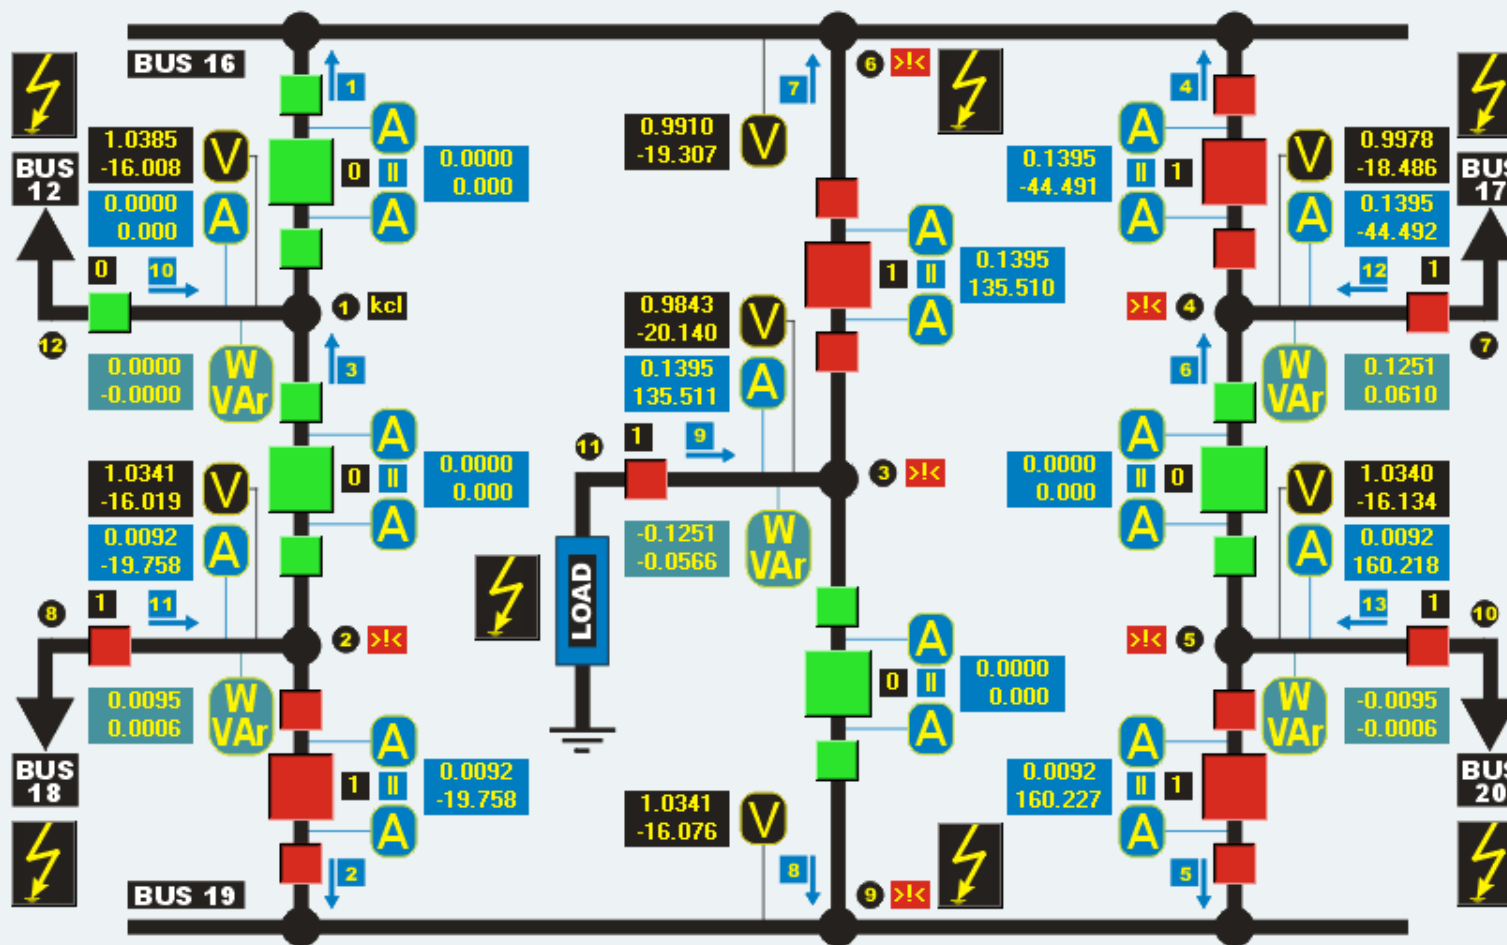

# Substation State Estimation Software

analog & digital measurement simulation & processing

Software status:

- Control mode
- Line outage scenario
- Simulation paused

## Screenshot with example of GUI

### Processing reports:

- 32 KCL NOT satisfied for node 2
- 32 KCL NOT satisfied for node 3
- 32 KCL NOT satisfied for node 4
- 32 KCL NOT satisfied for node 5
- 32 KCL NOT satisfied for node 6
- 32 KCL NOT satisfied for node 9
